In the Claims

Please amend claims 22 and 87 as follows:

- 22. (Five Times Amended) A method for detecting a specific living target cell in a cell suspension of a mixed cell population, in a fluid system containing a mixed cell population, or in a cell suspension prepared from a solid tissue, with the exception of normal and malignant hematopoietic cells in blood and bone marrow, the method comprising the steps of:
- a. coating paramagnetic particles or beads with a first antibody or antibody
 fragment directed against a second antibody or antibody fragment;
- b. incubating the second antibody or antibody fragment with the cell suspension to bind the second antibody or antibody fragment with the target cell, thereby creating a cell mixture, wherein the second antibody or antibody fragment is directed against a membrane structure specifically expressed on the target cell and not on a non-target cell in the cell mixture;
- c. washing the cell mixture to remove unbound second antibody or antibody fragment;
- d. mixing the coated paramagnetic particles or beads with the washed cell mixture;
- e. incubating the washed cell mixture and the coated paramagnetic particles under gentle rotation at about 4°C until target cell-bead rosettes are formed; and
- f. visually detecting the target cell-bead rosettes after incubation; wherein the target cells are living and can be detected at a sensitivity of one target cell per 100 or more total cells.
- 87. (Four Times Amended) A method for detecting living tumor cells in a cell suspension of mixed cell population or in a cell suspension prepared from a solid tissue, with the exception of normal and malignant hematopoietic cells in blood and bone marrow, comprising:
- a) coating paramagnetic particles with a first antibody or fragment directed
 against a second tumor-specific monoclonal antibody or fragment;

- incubating the second tumor specific antibody or antibody fragment with b) the cell suspension to allow the second tumor specific antibody or antibody fragment to bind the turnor cells;
- washing the cell suspension to remove unbound second antibody or c) antibody fragment;
 - mixing the coated paramagnetic particles with the cell suspension; d)
- incubating the mixture at about 4°C under gentle rotation until tumor celle) bead rosettes are formed; and
- visually detecting the tumor cell-bead rosettes; wherein the target cells are living and can be detected at a sensitivity of one target cell per 100 or more total cells.
